Bước 2 : Cài Đặt Guacamole Client :

Download Guacamole Client bằng lệnh :

```
wget https://downloads.apache.org/guacamole/1.5.3/binary/guacamole-1.5.3.war
```

Bước 3 : Di chuyển Guacamole Client sang thư mục của Tomcat bằng lệnh :

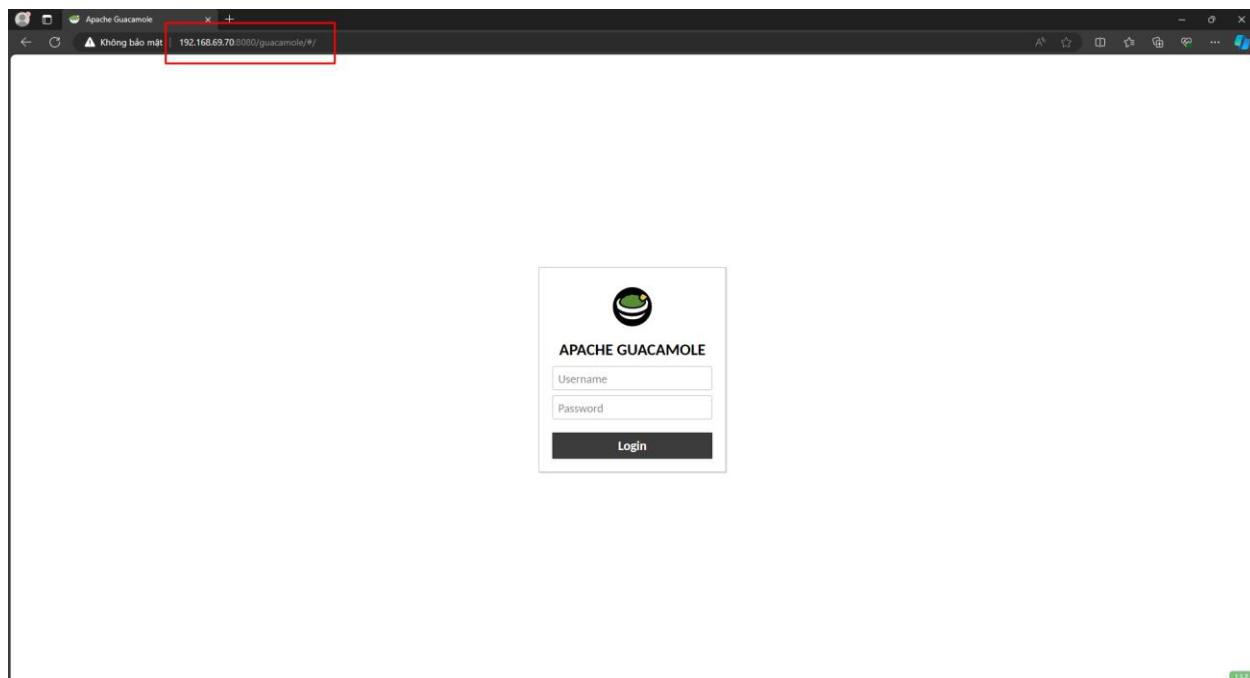

```
sudo mv guacamole-1.5.3.war /var/lib/tomcat9/webapps/guacamole.war
```

Bước 4 : Khởi động lại dịch vụ Guacamole và Apache Tomcat bằng lệnh :

```
systemctl restart tomcat9 guacd
```

Lúc này đã có thể truy cập được vào Web của Guacamole bằng :

<http://ip:8080/guacamole> , nhưng chưa thể đăng nhập do chưa có Database

Để có thể truy cập vào Guacamole trực tiếp mà không cần gõ /guacamole đằng sau , ta thực hiện như sau :

Bước 1 : Ngưng các dịch vụ của Tomcat lại bằng lệnh :
systemctl stop tomcat9

Bước 2 : Truy cập vào thư mục của Tomcat9 bằng lệnh

```
cd /var/lib/tomcat9/webapps/
```

Bước 3 : Xóa 2 thư mục Guacamole và thư mục ROOT bằng lệnh :

```
rm -rf guacamole && rm -rf ROOT
```

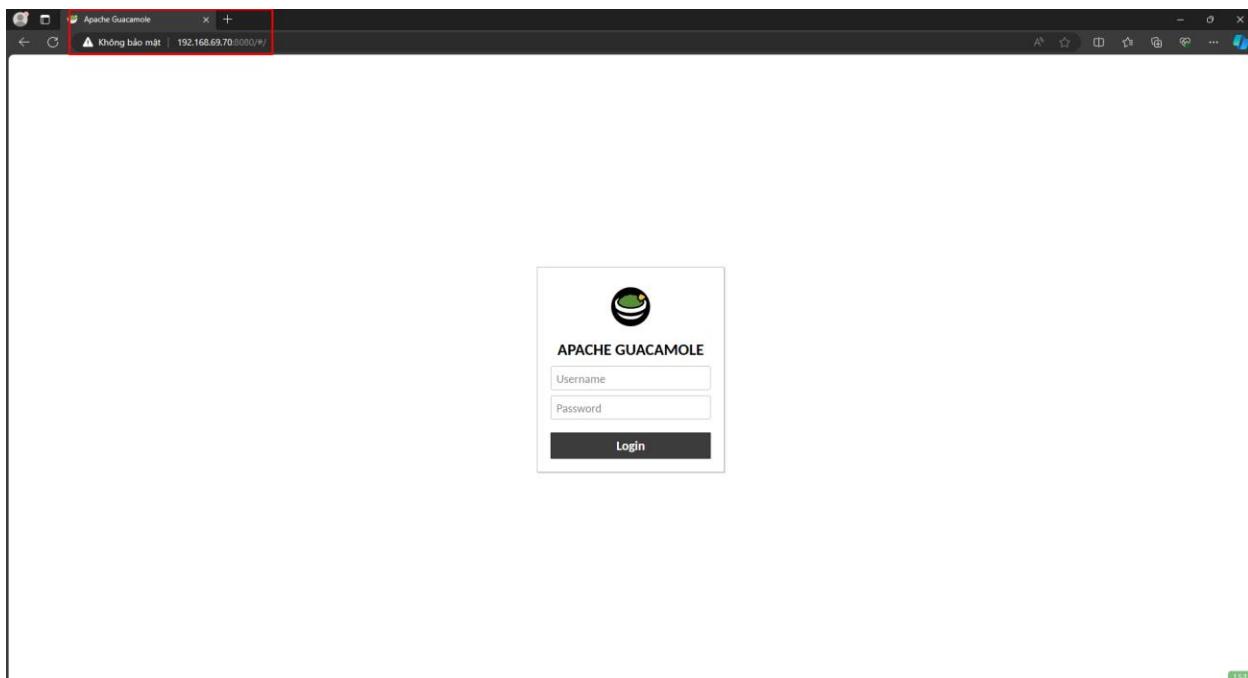

Bước 4 : Đổi tên file guacamole.war thành ROOT.war bằng lệnh :

```
mv guacamole.war ROOT.war
```

Bước 5 : Khởi động lại dịch vụ Tomcat9 :

```
Systemctl start tomcat9
```

Truy cập lại bằng địa chỉ IP và port đã thành công

- Phần 3 : Cài đặt Database và Plugins

Bước 1 : Tạo thư mục (extensions,lib) cho phần lưu cấu hình và các tiện ích cho Guacamole:

```
mkdir -p /etc/guacamole/{extensions,lib}
```

Bước 2 : Cài đặt MariaDB để tạo Database lưu User cho Guacamole :
apt install mariadb-server

Bước 3 : Tiến hành cấu hình MariaDB để cấu hình cho Guacamole :

Cấu hình bảo mật ban đầu cho MariaDB bằng lệnh :

```
mysql_secure_installation
```

- MariaDB yêu cầu nhập Password hiện tại , do ta mới cài đặt SQL nên ta sẽ nhấn Enter

```
root@guacamole:/var/lib/tomcat9/webapps# mysql_secure_installation

NOTE: RUNNING ALL PARTS OF THIS SCRIPT IS RECOMMENDED FOR ALL MariaDB
      SERVERS IN PRODUCTION USE! PLEASE READ EACH STEP CAREFULLY!

In order to log into MariaDB to secure it, we'll need the current
password for the root user. If you've just installed MariaDB, and
haven't set the root password yet, you should just press enter here.

Enter current password for root (enter for none):
```

Phần này ta gõ N .

```
Switch to unix_socket authentication [Y/n]
Enabled successfully!
Reloading privilege tables..
... Success!

You already have your root account protected, so you can safely answer 'n'
```

Phần này ta gõ Y để tiến hành thay đổi password của root:

```
Change the root password? [Y/n] y
New password:
Re-enter new password:
Password updated successfully!
Reloading privilege tables..
... Success!
```

Các phần tiếp theo ta gõ Y để cài đặt

```
By default, a MariaDB installation has an anonymous user, allowing anyone
to log into MariaDB without having to have a user account created for
them. This is intended only for testing, and to make the installation
go a bit smoother. You should remove them before moving into a
production environment.

Remove anonymous users? [Y/n] y
... Success!

Normally, root should only be allowed to connect from 'localhost'. This
ensures that someone cannot guess at the root password from the network.

Disallow root login remotely? [Y/n] y
... Success!

By default, MariaDB comes with a database named 'test' that anyone can
access. This is also intended only for testing, and should be removed
before moving into a production environment.

Remove test database and access to it? [Y/n] y
- Dropping test database...
... Success!
- Removing privileges on test database...
... Success!

Reloading the privilege tables will ensure that all changes made so far
will take effect immediately.

Reload privilege tables now? [Y/n] y
... Success!

Cleaning up...

All done! If you've completed all of the above steps, your MariaDB
installation should now be secure.
```

Như vậy đã cấu hình xong cài đặt cơ bản cho SQL

Buộc 4 : Download MySQL Connector/J (Java Connector) và guacamole-auth-jdbc để có thể kết nối và lưu trữ Database của Guacamole vào MariaDB:

```
cd
```

```
wget https://downloads.apache.org/guacamole/1.5.3/binary/guacamole-auth-jdbc-
